

CR-2026-045 — Live Test Record

Prospect member eligibility at the online enrolment gate — executed before/after evidence

Executed 3 August 2026, 15:00–15:06 IST · repo ams-s3-demo · branch s3-resolve-dropped-cr-targets at 3a5bd59
Target enrolldirect-prospect-access · ticket AMS-1045 · Python 3.12.13 · uvicorn 0.51.0
Companion docs: docs/ENROLDIRECT_APP.pdf · demo/DEMO_TEST_GUIDE.md

WHAT THIS DOCUMENT IS

A record of a test that was actually run, not a script to follow later. Every output block below is copied from the live service on localhost:8083 during the session named above — nothing here is illustrative or reconstructed. Where a step behaved differently from expectation, the document says so.

Why the change looked invisible

The starting complaint was that applying CR-2026-045 in the console produced no visible difference in the app. Two independent causes, both confirmed:

#	CAUSE	EFFECT ON STAGE
1	The post-apply link pointed at the wrong app. TARGET_APPS in useS3Controller.ts had an entry for ClaimsPortal only; every other target fell through to DEFAULT_TARGET_APP, the PolicyCore portal. Fixed — an enrolldirect-prospect-access entry now points at :8083.	"Applied — open the policy portal" sent the presenter to an app CR-2026-045 does not touch. Nothing there changes, because nothing there was changed.
2	The target service serves the code it imported at startup. apps/run-enrolldirect.sh ran plain uvicorn with no reload. Applying rewrites .py files on disk; a running process does not notice.	Even on the right app, :8083 keeps answering with the baseline while the console's diff insists the change landed.

THE TRAP IN ITS ORIGINAL FORM

In the session that prompted this test, the files changed at 14:53:06 and the EnrolDirect process had been running since 14:36. The change only became visible because the process happened to be restarted at 14:54:46. Had it not been, the demo would have shown an applied diff and an unchanged app.

Test subject

One applicant carries the whole scenario. **Devon Achebe** (AP-4003) is on contract MS-2001's roster holding no active benefit — the PROSPECT population neither access preference was written for. Two controls run alongside to prove the CR changed nothing else:

APPLICANT	NAME	CATEGORY	ROLE IN THE TEST
AP-4003	Devon Achebe	PROSPECT	The subject — refused before, admitted after
AP-4001	Rowan Iqbal	MEMBER	Control — must be unchanged
AP-4002	Priya Chandrasekar	GUEST	Control — must be unchanged

The run, step by step

0 Preserve the applied state

The CR was already applied in the working tree and uncommitted. Reverting to capture a "before" would have destroyed it, so it was snapshotted first and verified byte-identical on restore at the end.

```
git diff HEAD -- repos/enroldirect > scratch/CR-2026-045.patch # 254 lines
cp repos/enroldirect/{applicants,eligibility,enrolments,main}.py scratch/applied/
```

Confirmed beforehand that HEAD holds the clean baseline for this target on this branch — `git diff main -- repos/enroldirect` and `git diff HEAD -- repos/enroldirect` were identical, so no committed CR could be silently restored as "baseline".

1 Revert to baseline and restart

```
pskill -f "repos.enroldirect.main"
git checkout HEAD -- repos/enroldirect
PYTHONPATH=$PWD .venv/bin/uvicorn repos.enroldirect.main:app --port 8083
```

Baseline confirmed structurally, not just by file state — the pre-CR module has no prospect policy at all:

```
$ grep -c "PROSPECT_POLICY" repos/enroldirect/applicants.py
0
$ curl -s localhost:8083/health
{"status":"ok"}
```

2 BEFORE — the gate refuses the prospect

```
curl -X POST localhost:8083/api/eligibility/check \
-H 'content-type: application/json' -d '{"applicantId":"AP-4003"}'
```

```
{
  "granted": false,
  "applicantId": "AP-4003",
  "fullName": "Devon Achebe",
  "category": "PROSPECT",
  "requiredPreference": null,
  "authorisingPreference": null,
  "reasons": [
    "Applicant category PROSPECT has no online enrolment preference
    and cannot be granted access."
  ]
}
```

This is the refusal the CR describes as "not a decision anyone took" — the narrower option in force by omission. Note `requiredPreference` is `null`: there is no preference to check against, so the second gate cannot pass.

3 BEFORE — the enrolment path refuses too

```
curl -X POST localhost:8083/api/enrolments -H 'content-type: application/json' \
-d '{"applicantId":"AP-4003","planCode":"PL-1001","coverageTier":"Single"}'
```

```
{
  "reference": "ENR-000001",
  "status": "REFUSED",
  "refusalCode": "NO_CHANNEL_ACCESS",
  "category": "PROSPECT",
  "authorisingPreference": null,
  "coverageTier": null,
  "monthlyPremium": null
}
```

CORRECTION MADE DURING THE RUN

The first attempt at this step sent "tier" and got a 422 Field required on coverageTier. The request field is coverageTier, not tier. Worth knowing before typing it live in front of an audience.

4 BEFORE — the catalogue already disagrees with the gate

```
curl -s localhost:8083/api/applicants/AP-4003/plans
```

```
category: PROSPECT | effectiveCategory: None
  PL-1001 Extended Health Care      memberOnly=False available=True
  PL-1002 Dental Care              memberOnly=False available=True
  PL-1003 Health Care Spending Top-Up memberOnly=True  available=False
      -> "Requires existing coverage under the contract."
```

THE SUBTLEST BEFORE/AFTER ON THE PAGE

Pre-CR the catalogue offers this applicant two plans as available: true while the gate refuses them outright, and effectiveCategory is null. The catalogue and the gate are describing the same person differently. That is precisely the inconsistency the CR's last acceptance bullet closes — and it is visible without changing a single line of the console UI.

5 Restart with the new reload switch, still on baseline

Rather than restart manually, the run exercised the fix added to `apps/run-enroldirect.sh`:

```
TARGET_RELOAD=1 ./apps/run-enroldirect.sh
```

```
EnrolDirect -> http://localhost:8083/
(TARGET_RELOAD=1 - watching repos/enroldirect for applied changes)
INFO:      Started reloader process [35986] using WatchFiles
```

Verified it was still serving the baseline before the apply, so the next step proves the reload rather than a coincidence:

```
granted = False | reason = Applicant category PROSPECT has no online enrolment preferen...
```

6 APPLY — with no manual restart

```
cp scratch/applied/{applicants,eligibility,enrolments,main}.py repos/enroldirect/
# files applied at 15:05:33
```

```
WARNING: WatchFiles detected changes in 'repos/enroldirect/enrolments.py',
        'repos/enroldirect/eligibility.py', 'repos/enroldirect/applicants.py',
        'repos/enroldirect/main.py'. Reloading...
INFO:      Started server process [36051]
```

The service picked the change up on its own. This is the step that removes cause #2 from the demo.

7 AFTER — the gate admits the prospect, and says under what

```
{
  "granted": true,
  "applicantId": "AP-4003",
  "fullName": "Devon Achebe",
  "category": "PROSPECT",
  "requiredPreference": "Online Enrolment - Guest",
  "authorisingPreference": "Online Enrolment - Guest",
  "prospectPolicyApplied": "GUEST",
  "reasons": ["Granted under 'Online Enrolment - Guest'."]
}
```

Three fields carry the CR's intent, not just the boolean: `category` still reports what the applicant *is* (PROSPECT), `authorisingPreference` reports what actually opened the gate (Guest), and `prospectPolicyApplied` records *why* those differ. A prospect admitted as a guest is recorded as such — which is what the CR requires for DocumentHub and NightlyBatch downstream.

8 AFTER — admitted at the gate, still narrowed past it

Enrolling in an open plan now succeeds:

```
PL-1001 Extended Health Care
status: SUBMITTED          coverageTier: Single
effectiveCategory: GUEST   prospectPolicyApplied: GUEST
reasons: ["Access granted under 'Online Enrolment - Guest'.",
          "Enrolled in 'Extended Health Care' at Single tier."]
```

Enrolling in a member-only plan is refused — for a different reason than before:

```
PL-1003 Health Care Spending Top-Up
status: REFUSED
refusalCode: PLAN_REQUIRES_EXISTING_COVERAGE    <- not NO_CHANNEL_ACCESS
effectiveCategory: GUEST
reasons: ["'Health Care Spending Top-Up' attaches to existing coverage under
          the contract and is open to members only.",
          "This applicant is categorised GUEST."]
```

THIS IS THE DEMO'S STRONGEST SINGLE FRAME

The CR states the classification "decides two things, not one, and both are in scope... the two effects run in opposite directions". Here they are in one screen: the Guest policy *admits* Devon at the gate and *narrows* what Devon can reach past it. The refusal code moving from `NO_CHANNEL_ACCESS` to `PLAN_REQUIRES_EXISTING_COVERAGE` is the proof that AC2's "every existing refusal code keeps its current meaning" holds — the refusal moved from the gate to the catalogue, deliberately.

Before / after at a glance

OBSERVATION	BEFORE (BASELINE)	AFTER (CR APPLIED)
Gate decision, AP-4003	granted: false	granted: true
Preference resolved	null	Online Enrolment - Guest
Policy recorded on the decision	field absent	prospectPolicyApplied: GUEST
Effective category on the catalogue	null (disagrees with the gate)	GUEST
Enrolment in PL-1001 (open plan)	REFUSED · NO_CHANNEL_ACCESS	SUBMITTED · Single tier
Enrolment in PL-1003 (member-only)	REFUSED · NO_CHANNEL_ACCESS refused at the gate	REFUSED · PLAN_REQUIRES_EXISTING_COVERAGE refused at the catalogue
Control — MEMBER AP-4001	granted, under Member	granted, under Member prospectPolicyApplied: null
Control — GUEST AP-4002	granted, under Guest	granted, under Guest prospectPolicyApplied: null

Both controls are byte-identical across the change except for the new prospectPolicyApplied field, which is null for them — exactly as the CR specifies ("populated for prospects and null for everyone else").

Independent regression evidence

tests/test_regression_enrolldirect.py is the human-authored suite the pipeline is forbidden to write to. It is an invariant check, so it must pass on both sides of the CR — and did:

STATE	COMMAND	RESULT
Baseline	pytest tests/test_regression_enrolldirect.py -q	24 passed in 0.21s
CR applied	pytest tests/test_regression_enrolldirect.py -q	24 passed in 0.22s

RUN THE FILE, NOT THE DIRECTORY

A bare `pytest tests/` reaches an unpatched beat that makes **live, billable LLM calls** when `.cache/llm` is cold. Both runs above named the single file deliberately. Keep it that way in any rehearsal.

What this run does not evidence

- **The console's own Apply path.** Step 6 copied the snapshotted files in directly, so what is proven is that the applied code produces these results — not that the console's Apply button wrote them. That path was exercised separately in the session that produced the snapshot.
- **The generated test suite.** Not run here; the console still reported "the generated suite has not been run against this change yet", which is why the commit gate stays closed.
- **Source control.** Nothing was committed or pushed by the pipeline — `scm.py` models branch/commit/push and runs no git, by design.
- **Any live LLM call.** The whole run is replay/deterministic; no model was invoked at any step above.

Presenter cut — the 90-second version

1. EnrolDirect at `localhost:8083` → **Access check** → Devon Achebe. Read the refusal aloud: *"PROSPECT has no online enrolment preference."*
2. Console → Apply CR-2026-045.
3. Back to **Access check** → same applicant → *granted*, under *Online Enrolment - Guest*, with the policy named on the decision.
4. **Enrol in a benefit** → Devon → catalogue now resolves them as GUEST; enrol in Extended Health Care (succeeds), then Health Care Spending Top-Up (refused, and for a different reason). That contrast is the point of the CR.

TWO THINGS TO HAVE SET BEFORE YOU PRESENT

Start EnrolDirect with `TARGET_RELOAD=1` so step 2 lands without a restart — or restart `:8083` by hand between steps 2 and 3. And the post-apply link in the console now goes to EnrolDirect rather than the policy portal; if you are running an older build, ignore it and go to `:8083` directly.
